

24m0847 CS790 Assignment Task 1

Task 1

Requirements:

1. One VM running FreeBSD 13.4 (preferred) with no X window. You could use a very lean configuration — e.g., 2 cores and 2 GB RAM. This should be acting as a L3 forwarding firewall. You need to enable the IP routing for the same. We would rely on FreeBSD pf firewall for this exercise.

1. Created **VM2** with following configurations:

2. Two other VMs running any OS of your choice (Linux or FreeBSD) with as minimal configuration as possible.

1. Created **VM1** with following configurations:

2. Created **VM3** with following configurations:

3. The three VMs must be connected using virtual networks.

- **VM1 :**

Network

Adapter 1: Intel PRO/1000 MT Desktop (Bridged Adapter, Qualcomm Atheros QCA9377 Wireless Network Adapter)
Adapter 2: Intel PRO/1000 MT Desktop (Internal Network, 'networkA')

- VM2 :

Network

Adapter 1: Intel PRO/1000 MT Desktop (Bridged Adapter, Qualcomm Atheros QCA9377 Wireless Network Adapter)
 Adapter 2: Intel PRO/1000 MT Desktop (Internal Network, 'networkA')
 Adapter 3: Intel PRO/1000 MT Desktop (Internal Network, 'networkB')

- VM3 :

Network

Adapter 1: Intel PRO/1000 MT Desktop (Bridged Adapter, Qualcomm Atheros QCA9377 Wireless Network Adapter)
 Adapter 2: Intel PRO/1000 MT Desktop (Internal Network, 'networkB')

- Adapter1 is Bridged Adapter for doing SSH from Host OS to access all 3 Guest OSes .
- Example:

```

vansil@192.168.0.104 ~ ssh vansil@192.168.0.104
(vansil@192.168.0.104) Password for vansil@firewall.com:

Documents installed with the system are in the /usr/local/share/doc/
c/freebsd/
directory, or can be installed later with: pkg install en-freebsd
-doc
For other languages, replace "en" with a language code like de or
fr.

Show the version of FreeBSD installed: freebsd-version ; uname -a
Please include that output and any error messages when posting que
stions.
Introduction to manual pages: man man
FreeBSD directory layout: man hier

To change this login announcement, see motd(5).
To see how much disk space is left on your UFS partitions, use

df -h
-- Dru <genesis@istar.ca>
vansil@firewall:~ $

vm@192.168.0.106 FreeBSD directory layout: man hier
To change this login announcement, see motd(5).
ZFS keeps a history of commands run against a specific pool using
the
history subcommand to zpool:

zpool history

More details are available using the -i and -l parameters. Note th
at ZFS
will not keep the complete pool history forever and will remove ol
der
events in favor of newer ones.
-- Benedict Reuschling <bcr@FreeBSD.org>
vansil@firewall:~ $

vm@192.168.0.107 directory, or can be installed later with: pkg install en-freebsd
-doc
For other languages, replace "en" with a language code like de or
fr.

Show the version of FreeBSD installed: freebsd-version ; uname -a
Please include that output and any error messages when posting que
stions.
Introduction to manual pages: man man
FreeBSD directory layout: man hier

To change this login announcement, see motd(5).
nc(1) (or netcat) is useful not only for redirecting input/output
to
TCP or UDP connections, but also for proxying them with inetd(8).
vansil@firewall:~ $ |
  
```

- We will look at this in details in upcoming answers.

Objective: The The assignment is designed to allow you to get your hands dirty with FreeBSD pf (an industry standard firewall framework) to filter traffic.

- You would require configuring the three VMs using the configurational setup

Figure 1: VM network arrangement.

a) Assign private IP addresses to each interface so the VMs can ping one another. VM1 (eth0) and VM2 (eth0) should be in the same subnet. VM2(eth1) and VM3 (eth0) should be in the same subnet. (5 points)

- Created 2 Subnets:

networkA = 192.168.25.0/30

networkB = 192.168.25.4/30

- Private IP addresses to each interface:

```
# VM1
em0 : 192.168.0.106 # used for SSH from Host OS (DHCP)
em1 : 192.168.25.1 # networkA (Static IP)

# VM2
em0 : 192.168.0.104 # used for SSH from Host OS (DHCP)
em1 : 192.168.25.2 # networkA (Static IP)
em2 : 192.168.25.5 # networkB (Static IP)

# VM3
em0 : 192.168.0.107 # used for SSH from Host OS (DHCP)
em1 : 192.168.25.6 # networkB (Static IP)
```

- How to update IP addresses?
 - edit `/etc/rc.conf` as following...

- machine ips (192.168.25.x) setup (ignore `PF_enable` lines as `pf.conf` was empty)

```

GNU nano 8.2 /etc/rc.conf
hostname="firewall.com"
ifconfig_em0="DHCP"
ifconfig_em1="inet 192.168.25.2 netmask 255.255.255.252"
ifconfig_em2="inet 192.168.25.5 netmask 255.255.255.252"
sshd_enable="YES"
# Set dumpdev to "AUTO" to enable crash dumps, "NO" to disable
dumpdev="AUTO"

sshd_enable="YES" # enable ssh
pf_enable="YES" # enable pf (load module if required)
pflog_enable="YES" # start pflogd(8)

root@firewall:/home/vansil #

GNU nano 8.2 /etc/rc.conf
hostname="vm1.com"
ifconfig_em0="DHCP"
ifconfig_em1="inet 192.168.25.1 netmask 255.255.255.252"
sshd_enable="YES"
# Set dumpdev to "AUTO" to enable crash dumps, "NO" to disable
dumpdev="AUTO"

root@vm1:/home/vm #

GNU nano 8.2 /etc/rc.conf
hostname="vm3.com"
ifconfig_em0="DHCP"
ifconfig_em1="inet 192.168.25.6 netmask 255.255.255.252"
sshd_enable="YES"
# Set dumpdev to "AUTO" to enable crash dumps, "NO" to disable
dumpdev="AUTO"

root@vm3:/home/vm #

```

- Reset network interfaces

```
/etc/rc.d/netif restart && /etc/rc.d/routing restart
```

- Ping within subnets (VM1-VM2 and VM2-VM3)

```

vansil@192.168.0.104
root@firewall:/home/vansil # ping 192.168.25.1

root@vm3:/home/vm #

```

- Within subnet ping is working but `IP forwarding` is not working at this point. For that, let's move to next requirement `1.1.b`.

b) Setup IP forwarding on VM2 such that VM1 can ping both interfaces IPs of VM2 and VM3. Make sure traffic from VM1 to VM3 goes via VM2 (can be seen via traceroute). (5 points)

- Enable IP Forwarding on `vm2`:
- Enable gateway (`/etc/rc.conf`):

```
gateway_enable="YES"
```

- VM2

```
GNU nano 8.2 /etc/rc.conf
hostname="firewall.com"
ifconfig_em0="DHCP"
ifconfig_em1="inet 192.168.25.2 netmask 255.255.255.252"
ifconfig_em2="inet 192.168.25.5 netmask 255.255.255.252"
sshd_enable="YES"
# Set dumpdev to "AUTO" to enable crash dumps, "NO" to disable
dumpdev="AUTO"

pf_enable="YES"      # enable pf (load module if required)
pflog_enable="YES"   # start pflogd(8)
gateway_enable="YES"
```

- restart service routing

```
service routing restart
```

- VM2

```
root@firewall:/home/vansil # service routing restart
delete host 127.0.0.1: gateway lo0
delete host ::1: gateway lo0
delete net fe80::: gateway ::1
delete net ff02::: gateway ::1
delete net ::ffff:0.0.0.0: gateway ::1
delete net ::0.0.0.0: gateway ::1
add host 127.0.0.1: gateway lo0
Additional inet routing options: gateway=YES.
add host ::1: gateway lo0
add net fe80::: gateway ::1
add net ff02::: gateway ::1
add net ::ffff:0.0.0.0: gateway ::1
add net ::0.0.0.0: gateway ::1
root@firewall:/home/vansil # |
```

- Set routes on VM1 and VM3
- VM1 (Route to VM3 via VM2)

```
static_routes="networkB"
route_networkB="-net 192.168.25.4/30 192.168.25.2"
```

- VM3 (Route to VM1 via VM2)

```
static_routes="networkA"
route_networkA="-net 192.168.25.0/30 192.168.25.5"
```

- /etc/rc.conf

The image shows two terminal windows side-by-side, both running GNU nano 8.2 to edit /etc/rc.conf. The top window is for VM1 (IP 192.168.0.106) and the bottom window is for VM3 (IP 192.168.0.107). Both configurations set the hostname, network interface (em0), and enable SSH. They also configure static routes for a specific network (192.168.25.4/30 for VM1 and 192.168.25.0/30 for VM3) with a gateway at 192.168.25.2 and 192.168.25.5 respectively. The prompt in the bottom window is root@vm3:/home/vm # |.

```
vm@192.168.0.106
GNU nano 8.2 /etc/rc.conf
hostname="vm1.com"
ifconfig_em0="DHCP"
ifconfig_em1="inet 192.168.25.1 netmask 255.255.255.252"
sshd_enable="YES"
# Set dumpdev to "AUTO" to enable crash dumps, "NO" to disable
dumpdev="AUTO"
static_routes="networkB"
route_networkB="-net 192.168.25.4/30 192.168.25.2"

root@vm1:/home/vm #

vm@192.168.0.107
GNU nano 8.2 /etc/rc.conf
hostname="vm3.com"
ifconfig_em0="DHCP"
ifconfig_em1="inet 192.168.25.6 netmask 255.255.255.252"
sshd_enable="YES"
# Set dumpdev to "AUTO" to enable crash dumps, "NO" to disable
dumpdev="AUTO"
static_routes="networkA"
route_networkA="-net 192.168.25.0/30 192.168.25.5"

root@vm3:/home/vm # |
```

- Add routes to VM3

A terminal window showing the command to add routes to VM3. The prompt is root@vm3:/home/vm #. The command is route add -net 192.168.25.0/30 192.168.25.5, followed by add net 192.168.25.0: gateway 192.168.25.5. The prompt ends with a vertical bar.

```
root@vm3:/home/vm # route add -net 192.168.25.0/30 192.168.25.5
add net 192.168.25.0: gateway 192.168.25.5
root@vm3:/home/vm # |
```

- Add routes to VM1

A terminal window showing the command to add routes to VM1. The prompt is root@vm1:/home/vm #. The command is route add -net 192.168.25.4/30 192.168.25.2, followed by add net 192.168.25.4: gateway 192.168.25.2. The prompt ends with a vertical bar.

```
root@vm1:/home/vm # route add -net 192.168.25.4/30 192.168.25.2
add net 192.168.25.4: gateway 192.168.25.2
root@vm1:/home/vm # |
```

- Check routing on VM2

```
netstat -rn
```

- netstat

```
root@firewall:/home/vansil # netstat -rn | grep 192.168.25
192.168.25.0/30      link#2          U              em1
192.168.25.2       link#2          UHS           lo0
192.168.25.4/30    link#3          U              em2
192.168.25.5       link#3          UHS           lo0
root@firewall:/home/vansil # |
```

- ping from VM1 to VM3 and VM3 to VM1

```

root@vm3:/home/vm # |
```

- Working Finally!

c) On VM3, install an HTTP server (e.g., Apache) on the VM3. Create a web directory and add some files to it. Enable the webserver process on port 80. (2 points)

- Install Apache

```
pkg install apache24
sysrc apache24_enable="YES"
service apache24 start
```

- Not able to use internet.
- Default Gateway issue.
- Add default gateway using `route add default 192.168.0.1` (em0) to hostel wifi router
- VM2:

```
root@firewall:/home/vansil # route add default 192.168.0.1
add net default: gateway 192.168.0.1
```

- Apache installing using `pkg install apache24` on VM2

```
=====  
Message from apache24-2.4.62:  
  
--  
To run apache www server from startup, add apache24_enable="yes"  
in your /etc/rc.conf. Extra options can be found in startup script  
.  
  
Your hostname must be resolvable using at least 1 mechanism in  
/etc/nsswitch.conf typically DNS or /etc/hosts or apache might  
have issues starting depending on the modules you are using.  
  
- apache24 default build changed from static MPM to modular MPM  
- more modules are now enabled per default in the port  
- icons and error pages moved from WWWDIR to DATADIR  
  
If build with modular MPM and no MPM is activated in  
httpd.conf, then mpm_prefork will be activated as default  
MPM in etc/apache24/modules.d to keep compatibility with  
existing php/perl/python modules!  
  
Please compare the existing httpd.conf with httpd.conf.sample  
and merge missing modules/instructions into httpd.conf!
```

- Enable Apache service at startup

```
sysrc apache24_enable="YES"  
service apache24 start
```

- VM2

```
root@firewall:/home/vansil # sysrc apache24_enable="YES"  
apache24_enable: -> YES  
root@firewall:/home/vansil # service apache24 start  
Performing sanity check on apache24 configuration:  
Syntax OK  
Starting apache24.  
root@firewall:/home/vansil # |
```

- Verify Apache is running

```
service apache24 status
```

- VM2

```
root@firewall:/home/vansil # service apache24 status
apache24 is running as pid 3443.
root@firewall:/home/vansil # |
```

- Update default gateway for VM1 and VM3:

```
vm@192.168.0.106  x + v - □ ×
192.168.25.1      link#2      UHS      lo0
192.168.25.4/30  192.168.25.2    UGS      em1
root@vm1:/home/vm # pkg update

add net default: gateway 192.168.0.1
root@vm3:/home/vm # |
```

- Install curl using `pkg install curl` on VM1 and VM3
- Testing using curl from VM1 and VM2

```
curl -I http://192.168.25.2  
curl -I http://192.168.25.5
```

- VM1 and VM3:

The image shows two terminal windows side-by-side. The top window is titled 'vm@192.168.0.106' and shows the output of a curl command to http://192.168.25.2. The output is an HTTP 200 OK response from an Apache/2.4.62 (FreeBSD) server, with a last-modified date of Mon, 17 Feb 2025 05:47:22 GMT. The bottom window is titled 'vm@192.168.0.107' and shows the output of a curl command to http://192.168.25.5. The output is also an HTTP 200 OK response from an Apache/2.4.62 (FreeBSD) server, with the same last-modified date.

```
vm@192.168.0.106  
root@vm1:/home/vm # curl -I http://192.168.25.2  
HTTP/1.1 200 OK  
Date: Mon, 17 Feb 2025 05:59:18 GMT  
Server: Apache/2.4.62 (FreeBSD)  
Last-Modified: Mon, 17 Feb 2025 05:47:22 GMT  
ETag: "2d-62e500eebf3e7"  
Accept-Ranges: bytes  
Content-Length: 45  
Content-Type: text/html  
  
root@vm1:/home/vm #  
  
vm@192.168.0.107  
root@vm3:/home/vm # curl -I http://192.168.25.5  
HTTP/1.1 200 OK  
Date: Mon, 17 Feb 2025 05:59:37 GMT  
Server: Apache/2.4.62 (FreeBSD)  
Last-Modified: Mon, 17 Feb 2025 05:47:22 GMT

Accept-Ranges: bytes  
Content-Length: 45  
Content-Type: text/html  
  
root@vm3:/home/vm # |
```

- Create a web directory and add some files.

- Apache's default web root `/usr/local/www/apache24/data`

```
root@firewall:/home/vansil # cd /usr/local/www/apache24
root@firewall:/usr/local/www/apache24 # ls
cgi-bin data      error    icons
root@firewall:/usr/local/www/apache24 # cd data
root@firewall:/usr/local/www/apache24/data # ls
index.html
root@firewall:/usr/local/www/apache24/data # |
```

- create `web` directory:

```
mkdir -p web
```

- VM2:

```
root@firewall:/usr/local/www/apache24/data # mkdir -p web
root@firewall:/usr/local/www/apache24/data # ls
index.html      web
root@firewall:/usr/local/www/apache24/data # tree
├── index.html
└── web

2 directories, 1 file
root@firewall:/usr/local/www/apache24/data # |
```

- Add files `index.html`

```
<!-- index.html -->
This is an Apache server running on VM2
```

- Set correct ownership and permissions: [Ownership of Directory](#)

```
chown -R www:www /usr/local/www/apache24/web
chmod -R 755 /usr/local/www/apache24/web
```

- for `web` directory

```
root@firewall:/usr/local/www/apache24/data # chown -R www:www web
root@firewall:/usr/local/www/apache24/data # chmod -R 755 web
root@firewall:/usr/local/www/apache24/data # |
```

- Configure Apache to use new directory

nano /usr/local/etc/apache24/httpd.conf

- Edit DocumentRoot

```
GNU nano 8.2 /usr/local/etc/apache24/httpd.conf Modified
#
DocumentRoot "/usr/local/www/apache24/data/web"
<Directory "/usr/local/www/apache24/data/web">
#
# Possible values for the Options directive are "None", "All",
# or any combination of:
#   Indexes Includes FollowSymLinks SymLinksifOwnerMatch ExecCGI
#
# Note that "MultiViews" must be named *explicitly* --- "Options MultiViews"
# doesn't give it to you.
#
# The Options directive is both complicated and important. Please consult
# http://httpd.apache.org/docs/2.4/mod/core.html#options
# for more information.
#
Options Indexes FollowSymLinks

#
# AllowOverride controls what directives may be placed in .htaccess files.
# It can be "All", "None", or any combination of the keywords:
#   AllowOverride FileInfo AuthConfig Limit
#
AllowOverride None

#
# Controls who can get stuff from this server.
#
Require all granted
</Directory>

#
```

Help	Write Out	Where Is	Cut	Execute
Exit	Read File	Replace	Paste	Justify

- Restart `apache24`

```
root@firewall:/usr/local/www/apache24/data # service apache24 restart
Performing sanity check on apache24 configuration:
Syntax OK
Stopping apache24.
Waiting for PIDS: 3443.
Performing sanity check on apache24 configuration:
Syntax OK
Starting apache24.
root@firewall:/usr/local/www/apache24/data # |
```

- Check using command `curl http://192.168.25.x/index.html`
- Check in `VM1`

```
root@vm1:/home/vm # curl http://192.168.25.2/index.html
This is an Apache server running on VM2
root@vm1:/home/vm # |
```

- Check in `VM3`

```
root@vm3:/home/vm # curl http://192.168.25.5/index.html
This is an Apache server running on VM2
root@vm3:/home/vm # |
```

- Run Apache server on port 80:
- Check on which port it is currently running:

```
grep -i "listen" /usr/local/etc/apache24/httpd.conf
```

- Running on port `80` by default

```
root@firewall:/usr/local/www/apache24/data # grep -i "listen" /usr/local/etc/apache24/httpd.conf
# Listen: Allows you to bind Apache to specific IP addresses and/or
# Change this to Listen on specific IP addresses as shown below to
#Listen 12.34.56.78:80
Listen 80
root@firewall:/usr/local/www/apache24/data # |
```

d) You need to use `pf` on VM2, to restrict access only to port 80 and not allow anything else. To test the correct functionality, you could install an SSH server on VM3 and try to access it. Correct firewall functionality should restrict access to port 22 (SSH). (13 points)

- Check PF status

```
pfctl -s info
```

- VM2

```

root@firewall:~ # pfctl -s info
Status: Enabled for 0 days 01:50:27                                Debug: Urgent

root@firewall:~ #

```

- `/etc/rc.conf`

```
root@firewall:/etc # cat /etc/rc.conf
hostname="firewall.com"
ifconfig_em0="DHCP"
ifconfig_em1="inet 192.168.25.2 netmask 255.255.255.252"
ifconfig_em2="inet 192.168.25.5 netmask 255.255.255.252"
sshd_enable="YES"
# Set dumpdev to "AUTO" to enable crash dumps, "NO" to disable
dumpdev="AUTO"

pf_enable="YES"      # enable pf (load module if required)
pflog_enable="YES"   # start pflogd(8)
gateway_enable="YES"
apache24_enable="YES"
root@firewall:/etc # |
```

- It is already enabled. if not then use following
- Ways to Enable PF

```
sudo kldload pf
sudo pfctl -e
```

```
vansil@firewall:~ $ sudo kidload pf
sudo: kidload: command not found
vansil@firewall:~ $ sudo kldload pf
vansil@firewall:~ $ sudo pfctl -e
pf enabled
vansil@firewall:~ $
```

-
- Start pf

```
sudo /etc/rc.d/pf start
```

```
vansil@firewall:/etc $ sudo /etc/rc.d/pf start
Enabling pf.
```

- Stop pf

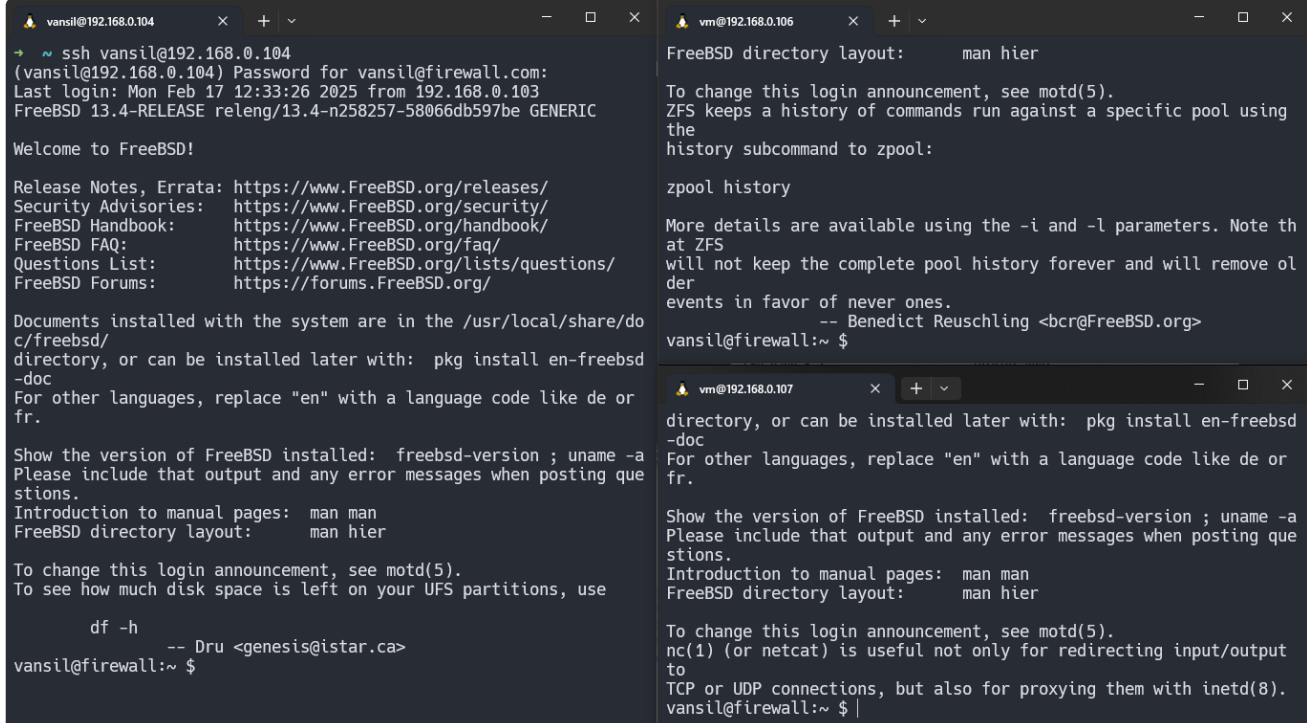

```
sudo /etc/rc.d/pf stop
```

```
vansil@firewall:/etc $ sudo /etc/rc.d/pf stop  
Disabling pf.
```

- Edit `rc.conf` to enable `PF`

```
sudo sysrc pf_enable="YES"  
sudo sysrc pflog_enable="YES"
```

- Configure Rules in `/etc/pf.conf`
- Rules
 - Block all
 - allow ssh 22 only from adapter0
 - from vm1 and vm3 it should be blocked.
 - allow access to port 80
- Before applying firewall... Doing ssh from `Host OS`, `VM1`, `VM3`

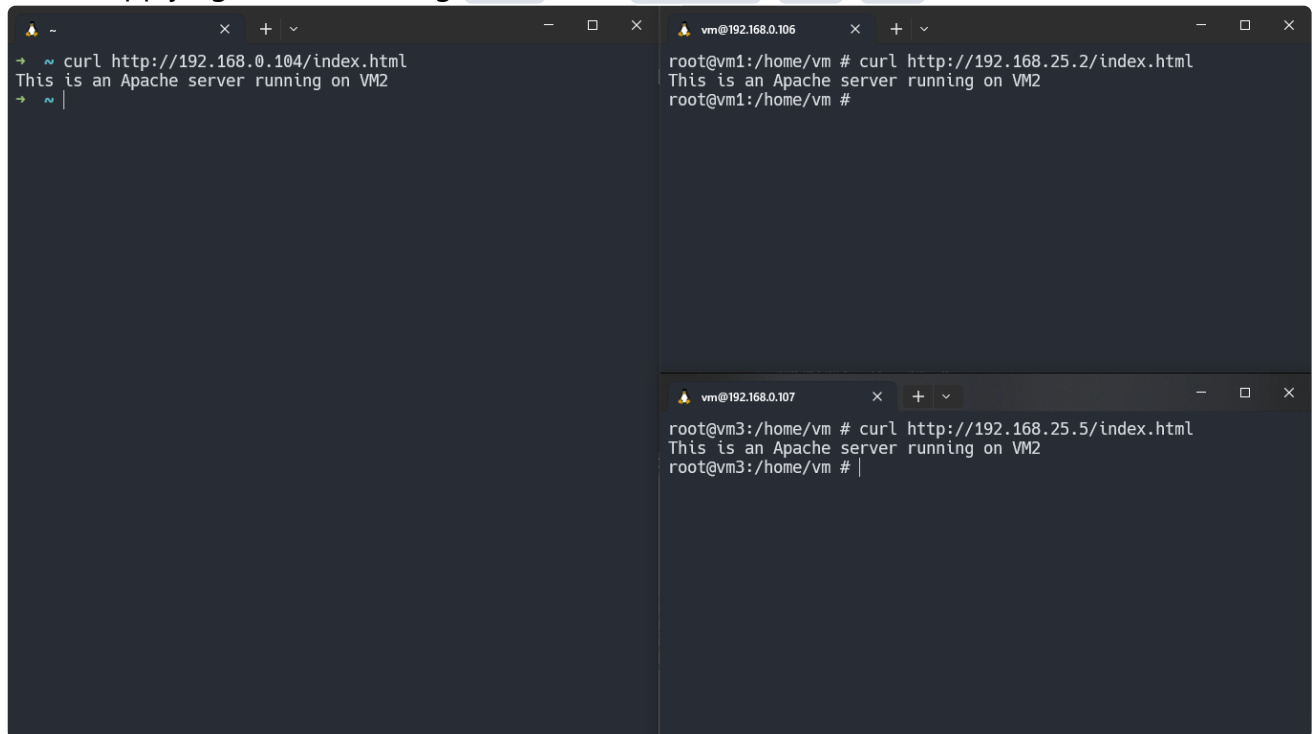

The image shows three terminal windows side-by-side, all connected to the firewall via SSH.

- Left window (Host OS):** Shows a successful SSH login from `vansil@192.168.0.104`. The user is prompted for a password and then greeted with the FreeBSD welcome message. The prompt is `vansil@firewall:~ $`.
- Middle window (VM1):** Shows a successful SSH login from `vm@192.168.0.106`. The user is greeted with the FreeBSD welcome message. The prompt is `vansil@firewall:~ $`.
- Right window (VM3):** Shows a successful SSH login from `vm@192.168.0.107`. The user is greeted with the FreeBSD welcome message. The prompt is `vansil@firewall:~ $`.

- ssh is working!

- Before applying firewall... Doing `curl` from Host OS, VM1, VM3

```
~ curl http://192.168.0.104/index.html
This is an Apache server running on VM2
~ |

vm@192.168.0.106 # curl http://192.168.25.2/index.html
This is an Apache server running on VM2
root@vm1:/home/vm #

vm@192.168.0.107 # curl http://192.168.25.5/index.html
This is an Apache server running on VM2
root@vm3:/home/vm #
```

- `curl` is working for `http` server.
- Let's apply following rules:

#pf.conf

block all

allow http port 80 for internal network
pass in proto tcp from any to any port 80

allow internal communication (icmp)
pass in proto icmp from any to any

- Rules:

A terminal window titled 'vansil@192.168.0.104' showing the contents of the file /etc/pf.conf. The file is being edited with GNU nano 8.2. The content of the file is:

```
block all

pass in proto tcp from any to any port 80

pass in proto icmp from any to any
```

- save and restart pf service.

```
pfctl -nf /etc/pf.conf # check for syntax errors
pfctl -f /etc/pf.conf
service pf restart
```

- VM2

A terminal window titled 'vansil@192.168.0.104' showing the application of PF rules. The user is root@firewall:/home/vansil. The commands and output are:

```
root@firewall:/home/vansil # cat /etc/pf.conf
block all

pass in on proto tcp from any to any port 80

pass in proto icmp from any to any
root@firewall:/home/vansil # pfctl -f /etc/pf.conf
/etc/pf.conf:3: syntax error
pfctl: Syntax error in config file: pf rules not loaded
root@firewall:/home/vansil # pfctl -nf /etc/pf.conf
/etc/pf.conf:3: syntax error
root@firewall:/home/vansil # |
```

- The moment Applied PF rules... SSH stuck

```
root@firewall:/home/vansil # pfctl -nf /etc/pf.conf
root@firewall:/home/vansil # pfctl -f /etc/pf.conf
```

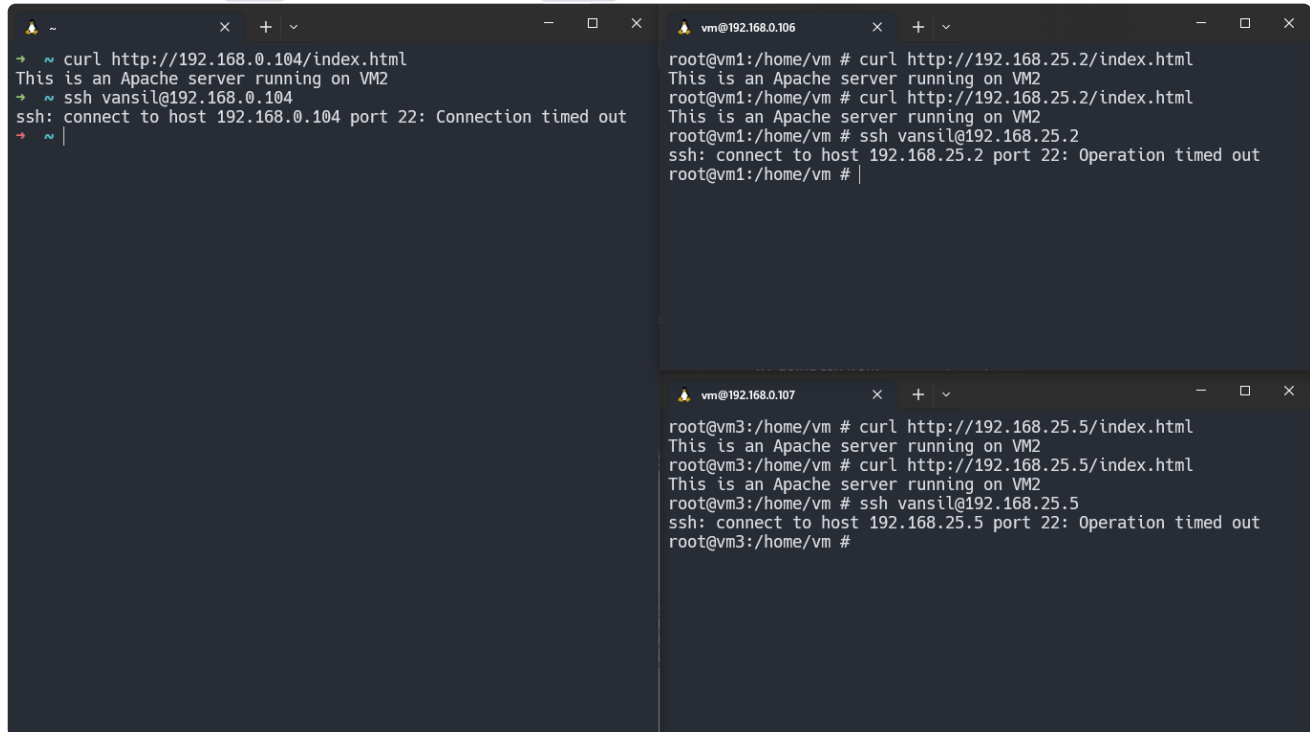

- Restart PF service. `service pf restart`
- Try using `curl` to server using Main PC, VM1, VM3
- Try doing ssh from Main PC, VM1, VM3

The image shows two terminal windows. The left window, titled 'vansil@192.168.0.104', shows a successful curl command to 'http://192.168.0.104/index.html' returning 'This is an Apache server running on VM2', followed by a successful ssh command to 'vansil@192.168.0.104'. The right window, titled 'vm@192.168.0.106', shows successful curl and ssh commands from 'root@vm1:/home/vm' to 'http://192.168.25.2/index.html' and 'vansil@192.168.25.2' respectively. Below it, a third window titled 'vm@192.168.0.107' shows successful curl and ssh commands from 'root@vm3:/home/vm' to 'http://192.168.25.5/index.html' and 'vansil@192.168.25.5' respectively.

- ssh not working from any machines but `http` server is accessible. Says connection timed out.

The image shows two terminal windows. The left window, titled '~', shows a successful curl command to 'http://192.168.0.104/index.html' returning 'This is an Apache server running on VM2', followed by an ssh command to 'vansil@192.168.0.104' that fails with the message 'ssh: connect to host 192.168.0.104 port 22: Connection timed out'. The right window, titled 'vm@192.168.0.106', shows successful curl commands from 'root@vm1:/home/vm' to 'http://192.168.25.2/index.html', but the ssh command to 'vansil@192.168.25.2' fails with 'ssh: connect to host 192.168.25.2 port 22: Operation timed out'. Below it, a third window titled 'vm@192.168.0.107' shows successful curl commands from 'root@vm3:/home/vm' to 'http://192.168.25.5/index.html', but the ssh command to 'vansil@192.168.25.5' fails with 'ssh: connect to host 192.168.25.5 port 22: Operation timed out'.

- Do ping work? **yes** because allowed **icmp**

The image shows three terminal windows. The top-left window is on a host with IP 192.168.0.104, showing a successful curl to http://192.168.0.104/index.html and a failed ssh connection to 192.168.0.104. The top-right window is on VM1 (192.168.0.106), showing successful curl to http://192.168.25.2/index.html and a failed ssh connection to 192.168.25.2. The bottom window is on VM3 (192.168.0.107), showing successful curl to http://192.168.25.5/index.html and a failed ssh connection to 192.168.25.5.

```
~ curl http://192.168.0.104/index.html
This is an Apache server running on VM2
~ ssh vansil@192.168.0.104
ssh: connect to host 192.168.0.104 port 22: Connection timed out
~

vm@192.168.0.106
root@vm1:/home/vm # curl http://192.168.25.2/index.html
This is an Apache server running on VM2
root@vm1:/home/vm # curl http://192.168.25.2/index.html
This is an Apache server running on VM2
root@vm1:/home/vm # ssh vansil@192.168.25.2
ssh: connect to host 192.168.25.2 port 22: Operation timed out
root@vm1:/home/vm #

vm@192.168.0.107
root@vm3:/home/vm # curl http://192.168.25.5/index.html
This is an Apache server running on VM2
root@vm3:/home/vm # curl http://192.168.25.5/index.html
This is an Apache server running on VM2
root@vm3:/home/vm # ssh vansil@192.168.25.5
ssh: connect to host 192.168.25.5 port 22: Operation timed out
root@vm3:/home/vm #
```

- Disable ping.
- New rules:

```
block all
```

```
pass in proto tcp from any to any port 80
```

- VM2

The screenshot shows a terminal window titled "VM2 [Running] - Oracle VirtualBox". The terminal is running the GNU nano 8.2 editor, editing the file /etc/pf.conf. The content of the file is as follows:

```
block all

pass in proto tcp from any to any port 80
```

The terminal prompt is root@firewall:~ #.

- save and restart pf service.

```
pfctl -nf /etc/pf.conf
pfctl -f /etc/pf.conf
service pf restart
```

- VM2

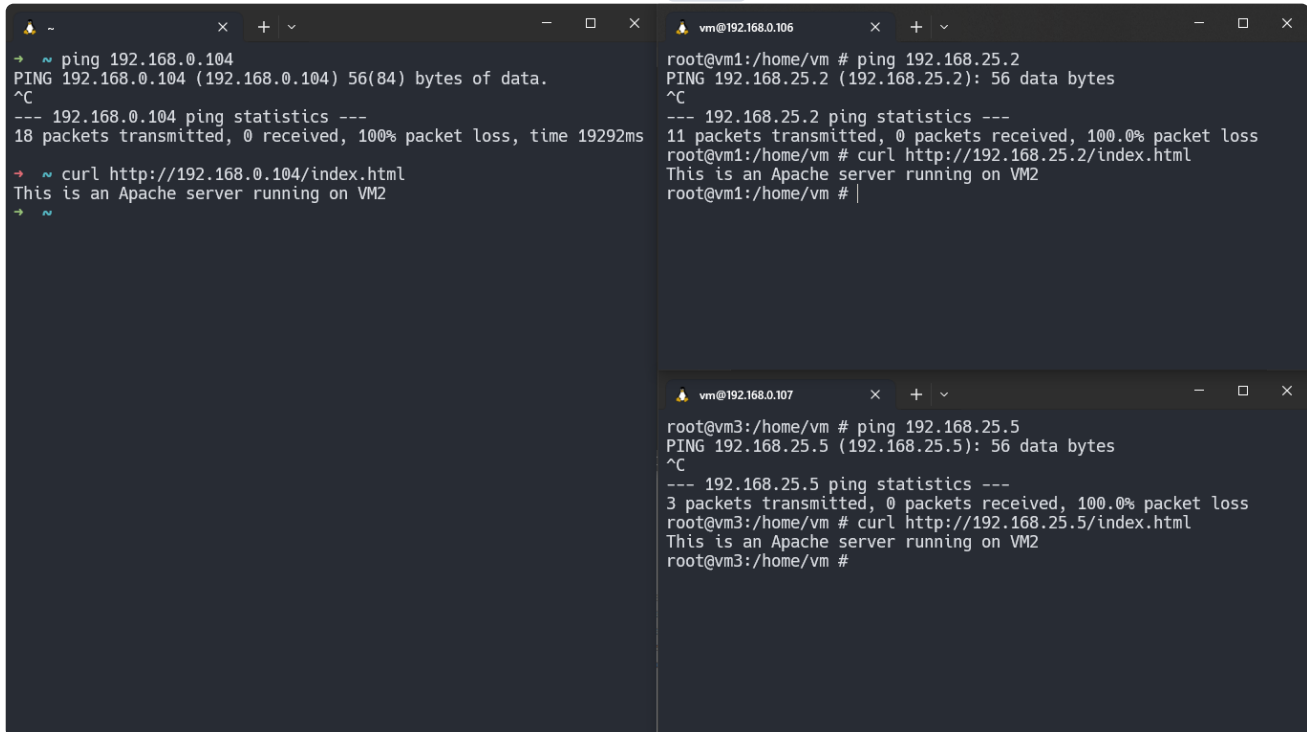

The screenshot shows a terminal window titled "VM2 [Running] - Oracle VirtualBox". The terminal is running the GNU nano 8.2 editor, editing the file /etc/pf.conf. The content of the file is as follows:

```
block all

pass in proto tcp from any to any port 80
```

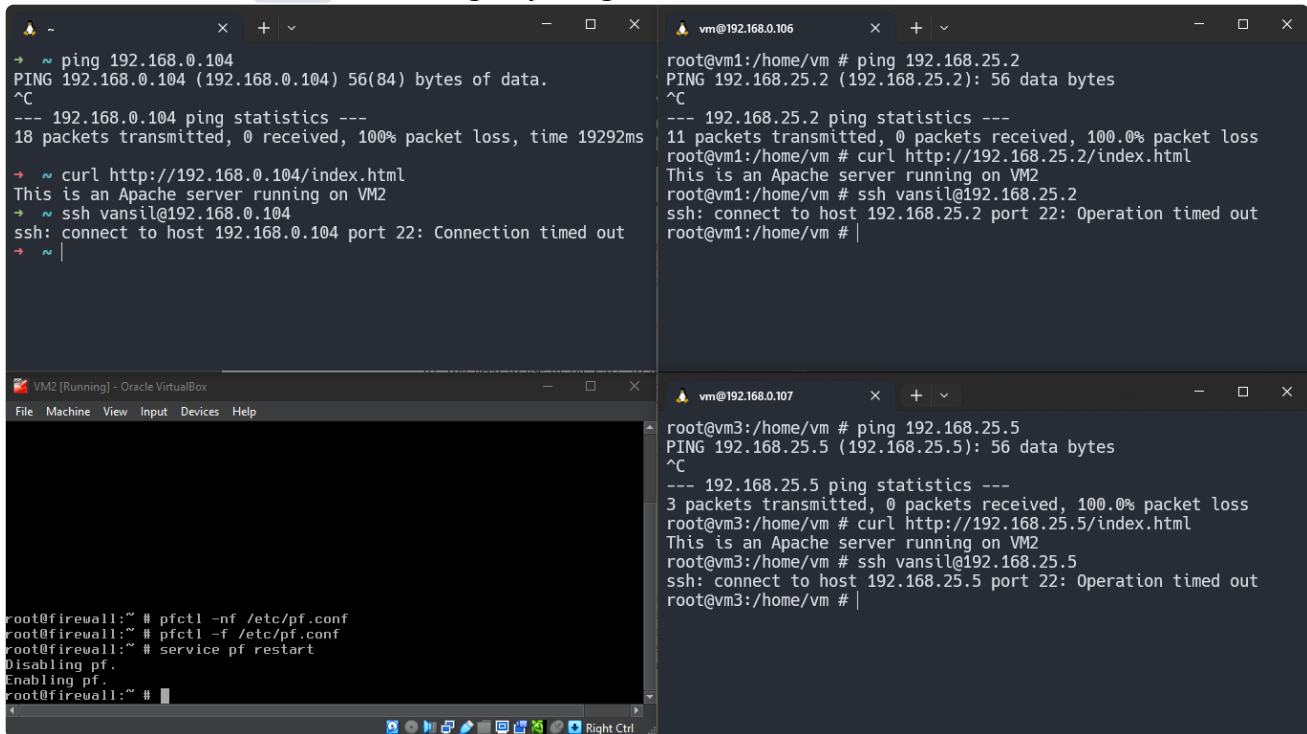

The terminal prompt is root@firewall:~ #.

- Check ping? Yes ping is also disabled and only **http** server access is allowed.

The image shows two terminal windows. The left window is a host terminal with IP 192.168.0.104. It shows a successful ping to 192.168.0.104 and a successful curl to http://192.168.0.104/index.html, which returns "This is an Apache server running on VM2". The right window is a VM terminal with IP 192.168.0.106. It shows a successful ping to 192.168.25.2 and a successful curl to http://192.168.25.2/index.html, which returns "This is an Apache server running on VM2". Below this, another VM terminal with IP 192.168.0.107 shows a failed ping to 192.168.25.5 (100% packet loss) and a successful curl to http://192.168.25.5/index.html, which returns "This is an Apache server running on VM2".

- Final Screenshot: **HTTP** is working anything else is blocked.

The image shows three terminal windows. The top-left window is a host terminal with IP 192.168.0.104, showing a successful ping to 192.168.0.104, a successful curl to http://192.168.0.104/index.html, and a failed ssh connection to 192.168.0.104 (connection timed out). The top-right window is a VM terminal with IP 192.168.0.106, showing a successful ping to 192.168.25.2, a successful curl to http://192.168.25.2/index.html, and a failed ssh connection to 192.168.25.2 (operation timed out). The bottom window is a VM terminal with IP 192.168.0.107, showing a failed ping to 192.168.25.5 (100% packet loss), a successful curl to http://192.168.25.5/index.html, and a failed ssh connection to 192.168.25.5 (operation timed out). Below these, a fourth terminal window shows the configuration of the firewall on the host, with commands: pfctl -nf /etc/pf.conf, pfctl -f /etc/pf.conf, service pf restart, Disabling pf., and Enabling pf.

Artifact Submission: Please create a “professional” report describing the steps involved in achieving each objective, with corresponding screenshots. Importantly, please write the commands used to enable routing (IPv4 forwarding) on VM2 and firewalling rules with a screenshot showing that it did so successfully. You also show a

screenshot where you run a traceroute from VM1 targeted to VM3. (5 Points)

- I have written all the correct steps that led me to completing assignment eventually. But also sharing extra pdf [24m0847 CS790 Assignment 1 Learnings](#) to verify my attempts and learning in coming to approximately correct steps.
-
